

Flexible and accurate skinning machine

---

# Skinning Machine Curio C-2031

- Delivers high capacity
- Features two lanes with independent control
- Capable of instantly switching from skin off to skin on production
- Remote monitoring system

# Flexible whitefish skinning

The Curio Skinning Machine is a flexible double skinning machine that delivers a high capacity and high yield. With the unique ability to independently control the right and left conveyors, processors have the option of switching between skin on and skin off without having to remove or change equipment in a line.

## Easy operation

A touch panel controls the machine's functions, and an ethernet connection enables remote monitoring, maintenance, and software upgrades. A skinning roller combined with an automatic, sensor-controlled pressure hold down system avoids damaging the fillets. An electronic measuring system ensures each fillet is accurately skinned according to its length. Processors benefit from production oversight with a camera at the outfeed while a fully height adjustable outfeed belt gently delivers fillets to the next station.
